YEAR 24 · NO. 9 · SEPTEMBER 2026

Infrastructure Report

Monthly publication of the National Confederation of Industry (CNI), with a navigable reading and the most recent data available through the month before publication.

Because the agencies that release the figures follow different update calendars, some indicators may lag well behind the reference period.

US$ 5.912 million

Oil and products trade balance

June 2026, FOB. In the same month of the previous year, US$ 2.672 million FOB.

R$ 84,7 billion

Investment line

1,3% of the total budget. R$ 24 billion liquidated.

R$ 188/MWh

PLD, Southeast and Central-West

20% below the same month of 2025.

R$ 7,28/L

Average diesel price

April 2026, 17% above April 2025 (R$ 6,22/L).

16,6 thousand GWh

Industrial electricity consumption

1% above the same month of 2025 and 36% of the total.

71 average GW

Generation on the national interconnected system

3% above June 2025. Hydro above 30 average MW: 56%.

151.411 GWh

Energy stored in reservoirs

2% above June 2025. South: 62%, 22 percentage points lower.

134 million bep

National oil production

19% above June 2025. About 98,1% from offshore fields.

US$ 19,91/MMBtu

Industrial consumer gas price

10% above September 2024 (US$ 18,13/MMBtu).

101 million t

Cargo at public ports and TUPs

February 2026, 4% higher. TUPs: 67%.

174 million

Traffic on tolled highways

17% above June 2025. Heavy vehicles: 34% higher.

49 million TU

Rail freight

Approximately the June 2025 level. Iron ore: 71%.

1 Investment

1.1 Overall and investment budget of the Federal government

In 2026, the total authorized appropriation recorded in Siga Brasil for the Federal budget was approximately R$ 6,5 trillion, based on the query of August 2026. Of that amount, approximately R$ 84,7 billion corresponds to the investment line, which represents 1,3% of the total budget.

Among parent bodies, the Ministry of Transport held the second-largest investment budget, at R$ 13,4 billion, which represented 16% of the total appropriation. The Ministry of Ports and Airports has an investment budget of R$ 836 million.

Of the Federal investment budget for 2026 (R$ 84,7 billion), R$ 53,8 billion had been committed, about 63,5% of the authorized appropriation through the end of August. Over the same period, R$ 24 billion was liquidated and R$ 22,6 billion was paid. Total payment, including carry-over payables paid in the period, came to R$ 46,1 billion.

Table 1 — Federal budget execution, investment by parent body (R$ million)

Parent body	Appropriation (a)	Commitment (b)	b/a	Liquidation (c)	c/a	Payment (d)	d/a	RAP paid (e)	Total paid	RAP to pay
Ministry of Transport	13.415	11.340	84,5%	6.934	51,7%	6.283	46,8%	2.959	9.242	1.517

Amounts below R$ 1 million are not described in the table.

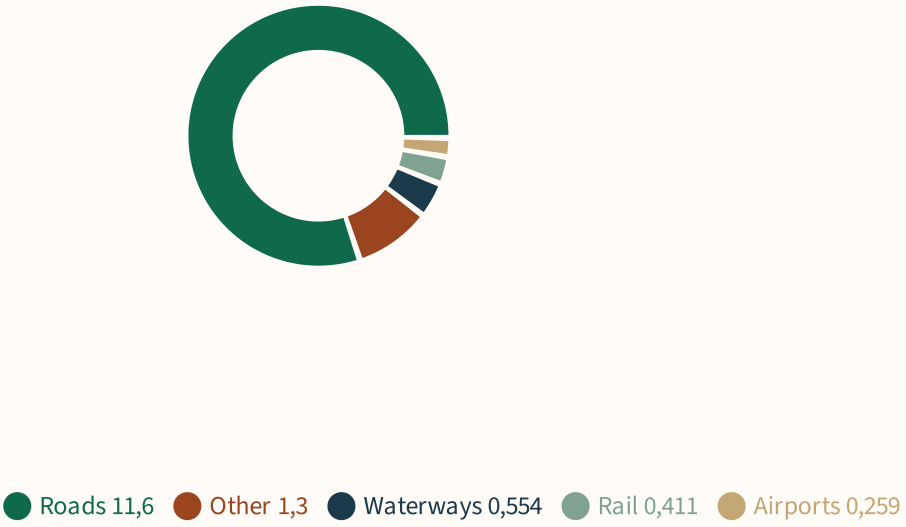

1.2 Overall and investment budget of the Ministry of Transport and the Ministry of Ports and Airports

Of the R$ 13,4 billion authorized for investment by the Ministry of Transport in 2026, about R$ 11,3 billion was committed (84,5% of the authorized appropriation) and approximately R$ 6,9 billion was liquidated. Amounts paid from the budget were about R$ 6,3 billion, and total disbursement (including paid carry-over payables) was R$ 9,2 billion.

As for the Ministry of Ports and Airports, of the R$ 836 million authorized for investment in 2026, R$ 471 million was committed, R$ 136 million was liquidated and R$ 122 million was paid.

Of the R$ 14,1 billion in investment authorized for the Ministry of Transport (R$ 13,4 billion) and for the Ministry of Ports and Airports (R$ 836 million), approximately 82% (R$ 11,6 billion) was allocated to roads. The remainder was divided among rail (R$ 411 million), waterways (R$ 554 million), airports (R$ 259 million) and other (R$ 1,3 billion).

Investment by mode (R$ billion)

Prepared by the authors with data from Siga Brasil.

Roads R$ 11,6 billion; other R$ 1,3 billion; waterways R$ 554 million; rail R$ 411 million; airports R$ 259 million.

Table 2 — Execution by mode, Transport and Ports and Airports (R$ million)

Mode	Appropriation	Commitment	b/a	Liquidation	Payment	Total paid
Airports	259	102	39%	25	25	60
Rail	411	104	25%	27	18	121
Waterways	554	315	57%	72	61	150
Roads	11.585	9.919	86%	5.930	5.194	7.755

Total	**14.095**	**11.022**	**78%**	**6.435**	**5.674**	**8.675**

Source: prepared by the authors with data from Siga Brasil.

Amounts below R$ 1 million are not described in the table.

The Federal government registered, in 2026, approximately R$ 8,1 billion in processed carry-over payables. Of that amount, the Ministry of Transport registered about R$ 159 million.

For unprocessed carry-over payables, the Federal government registered, in 2026, R$ 70,5 billion. The Ministry of Transport had R$ 4,4 billion registered and the Ministry of Ports and Airports R$ 439 million.

Of the total volume of carry-over payables registered by the Federal government, payments corresponded to 29% of the total registered, excluding cancellations. The Ministry of Transport paid 64% of the amount it registered for 2026. The Ministry of Ports and Airports paid 41% of its total registered.

Processed carry-over payables (R$ million)

Body	Registered	Cancelled	Paid	To pay
Ministry of Transport	159	0	131	29
Ministry of Ports and Airports	1	0	1	0

2 Electric power

2.1 Electric power generation (CCEE)

In June 2026, electric power generation on the national interconnected system recorded 71 average GW, 3% above the level observed in June 2025.

The source with the largest share was hydro at plants with generation capacity above 30 average MW (56% of the total). The generation source with the largest increase compared with the same month of the previous year was solar PV (30%).

Generation by source, June against June (average MW)

Prepared by the authors with data from CCEE. Table 4.

Percentages may not sum to 100% because of rounding.

Table 4 — Power generation by source (average MW)

Source	June 2025	June 2026	Change	Share
Hydro (>30 MW)	38.125	39.674	4%	56%
Thermal	10.265	11.105	8%	16%
Wind	14.239	13.065	-8%	18%
PCH and CGH	2.837	2.785	-2%	4%
Solar PV	3.139	4.068	30%	6%
Total	**68.604**	**70.697**	3%	**100%**

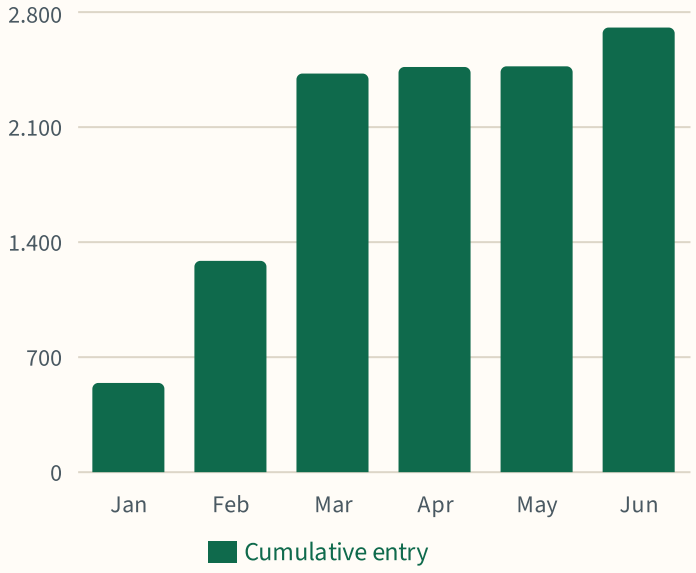

Source: prepared by the authors with data from CCEE.

2.2 Expansion of electric power generation capacity (ANEEL)

The chart below illustrates the cumulative expansion of generating capacity on the national interconnected system over the current year. The lines represent a theoretical average of uniform entry of generating capacity so that the forecast is met.

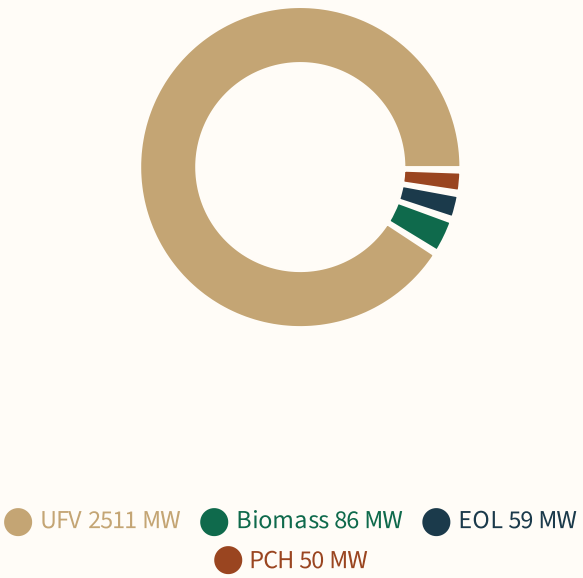

Between January and June 2026, 71 plants entered operation, with a total of 2706 MW of installed capacity. Of that total, wind plants (EOL) accounted for 59 MW, biomass plants for 86 MW, small hydro plants (PCHs) for 50 MW and solar PV plants (UFV) for 2511 MW.

Cumulative expansion in 2026 (MW)

Prepared by the authors with data from ANEEL. Points labeled on the chart through June.

Capacity that entered operation through June 2026

ANEEL, via CNI. Sum: 2706 MW.

Solar PV 93%, biomass 3%, PCH 2% and wind 2%.

2.2.1 Forecast of the expansion of electric power generation capacity

Conservative scenario: considers only plants with no restrictions on entry into operation.

Optimistic scenario: considers plants with no restrictions on entry into operation and plants with impediments such as an environmental license not obtained, construction not started and an undefined fuel contract.

Included in alternative sources are 50 MW referring to the entry of UHEs.

The forecast for 2026 is the one defined on 31/12/2025 for the following twelve months.

The estimates released by the National Electric Energy Agency (ANEEL) indicate, in the conservative scenario, an increase of 0,7% a year in the country's total electric generation capacity, for the period between the start of 2026 and the end of 2030.

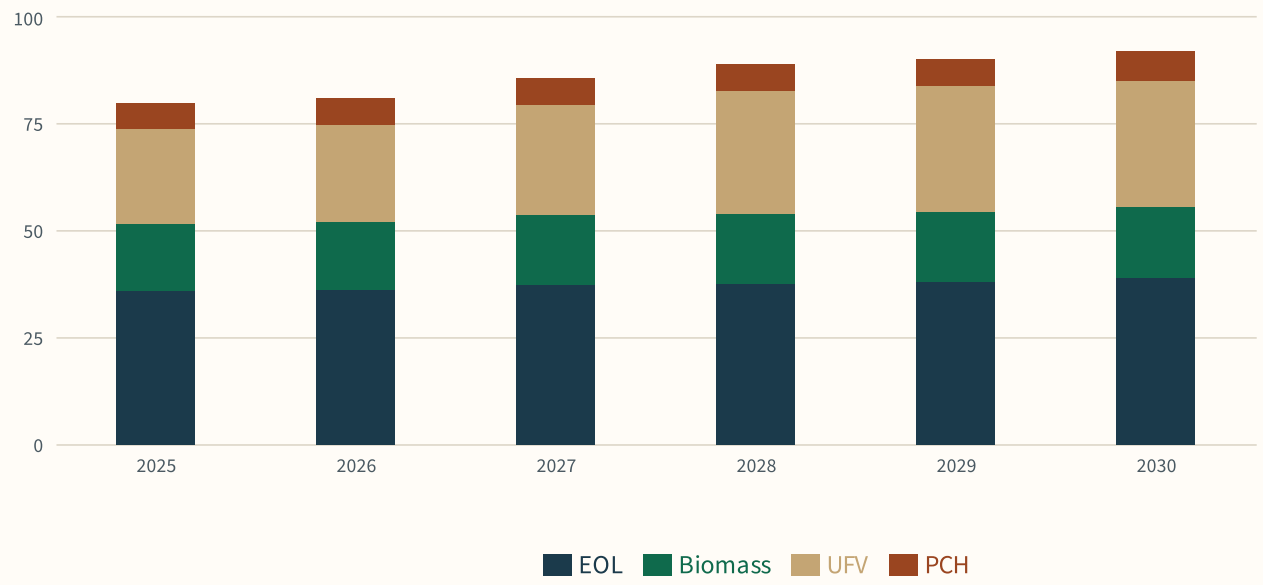

In the optimistic scenario, the expansion forecast is approximately 15 GW in the 2026–2030 period. In that scenario, the average growth rate of installed electric generation capacity would be 1,3% a year.

Between 2026 and 2030, in the conservative scenario, growth of 2% is estimated in Brazil's installed capacity of thermal plants (UTEs). Even with the expected expansion, the share of UTEs in total installed capacity is expected to remain at about 15% (excluding nuclear plants) through 2030. Hydro plants are expected to reduce their share of the national electric mix from 49% at the start of 2026 to 48% at the end of 2030.

At the end of 2026, alternative energy sources accounted for 36% of total installed capacity. The share of biomass thermal plants was 7% and, under the conservative forecast, that percentage is expected to be maintained through 2030. For wind plants (EOL), the forecast is that this source's share of installed capacity will rise to 16%, while the share of solar PV plants is estimated to increase from 10% to 11%. The share of small hydro plants (PCHs) is expected to remain at 3% through 2030.

The optimistic forecast for the expansion of generation from alternative energy sources is that their share will reach, by 2030, 39% of the country's installed capacity. Solar PV plants (UFV) have the largest forecast increase in installed capacity, with growth of 29%. In second place are wind plants, with a forecast 8% increase in capacity.

Installed capacity at each year-end — alternative sources, optimistic scenario (GW)

Prepared by the authors with data from ANEEL. For 2025, capacity on 31/12/2025.

Table 5 — Alternative sources (MW)

Scenario	2026	2027	2028	2029	2030	Σ
Conservative	1.180	3.499	268	27	6	4.980
Optimistic	1.180	4.655	3.384	1.164	1.619	12.002

Source: prepared by the authors with data from ANEEL. The 2026 forecast is the one set on 31/12/2025.

Alternative sources include 50 MW of large hydro. Fossil thermal: fuel oil, diesel, natural gas and coal.

Fossil thermal plants (MW)

Scenario	2026	2027	2028	2029	2030	Σ
Conservative	2.404	663	0	0	0	3.067
Optimistic	2.404	663	14	0	49	3.130

Source: prepared by the authors with data from ANEEL. The 2026 forecast is the one set on 31/12/2025.

Alternative sources include 50 MW of large hydro. Fossil thermal: fuel oil, diesel, natural gas and coal.

Sum of alternatives and fossil (MW)

Scenario	2026	2027	2028	2029	2030	Σ
Conservative	3.584	4.162	268	27	6	8.047
Optimistic	3.584	5.318	3.398	1.164	1.668	15.132

Source: prepared by the authors with data from ANEEL. The 2026 forecast is the one set on 31/12/2025.

Alternative sources include 50 MW of large hydro. Fossil thermal: fuel oil, diesel, natural gas and coal.

2.2.2 Expansion of distributed generation

Distributed generation can be defined as a source of electric power connected directly to the distribution network or sited at the consumer. In June 2026, 443 MW of installed capacity in distributed generation entered operation, 27% below the level observed in the same month of 2025.

Cumulative installed capacity in distributed generation, through June 2026, was 46.504 MW, 17% above the level recorded in the same period of 2025. Industry accounted for 7% of that total, with 3.263 MW of installed capacity.

Table 6 — Added distributed-generation capacity (MW)

Class	June 2025	June 2026	Change
Residential	336,4	270,6	-20%

Class	June 2025	June 2026	Change
Commercial	122,2	109,45	-10%
Rural	75,9	34,0	-55%
Industrial	60,5	21,2	-65%
Public lighting and government	12,4	7,9	-36%
Total	**607,3**	**443,1**	-27%

Source: prepared by the authors with data from ANEEL.

2.3 Expansion of transmission lines (MME)

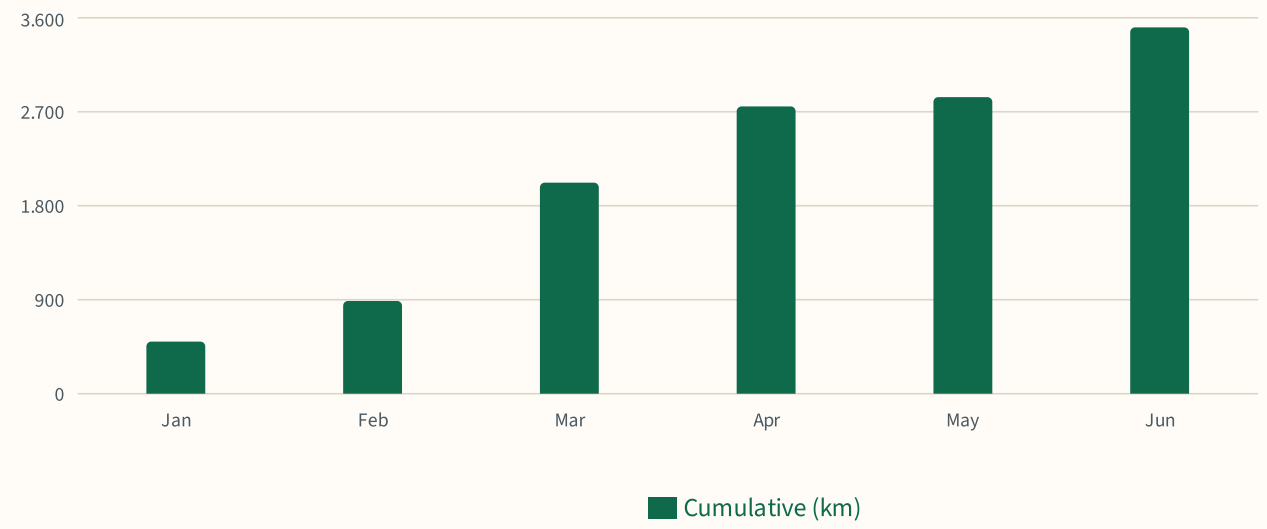

Transmission-line expansion data released by the Ministry of Mines and Energy (MME) lag the publication month of the Infrastructure Report.

In March 2026, 374 new km of transmission lines entered operation. According to the Ministry of Mines and Energy forecast, the expectation for 2026 is 4,7 thousand km of new transmission lines in operation in the country. For 2027, 4,4 thousand km of new transmission lines are forecast.

Transmission lines are divided by voltage classes that can use the electric grid. Of the total new lines that entered operation through March 2026, 66 km were in the 230 kV voltage class and 660 km were in the 500/525 kV voltage class.

Note: Considers the forecast released by the Ministry of Mines and Energy in January 2026.

Cumulative entry of transmission lines in 2026 (km)

Prepared by the authors with data from MME. Values labeled on the chart through June.

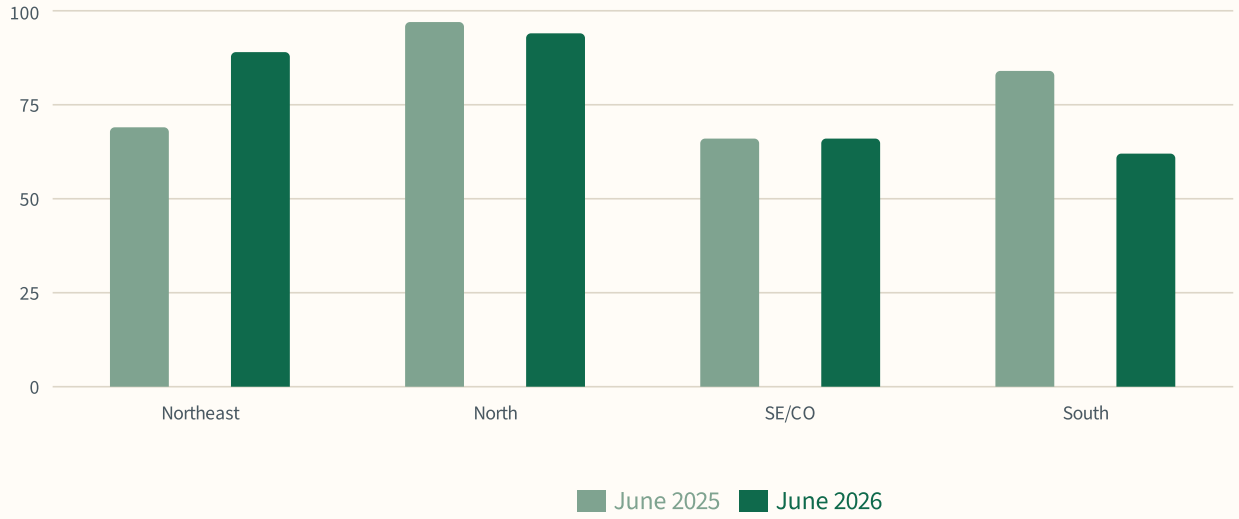

Uses the forecast released by the Ministry of Mines and Energy in January 2026.

2.4 Verified stored energy (ONS)

In June 2026, four of the five regions had a level of energy stored in reservoirs below that observed in the same month of the previous year. The South had reservoirs at 62%, 22 percentage points below the level observed in the same month of 2025. The Northeast had the largest increase in reservoir levels compared with June 2025.

In June 2026, Brazilian reservoirs had a level equivalent to 151.411 GWh of stored energy, 2% above the level observed for the same month in the previous year. The Southeast/Central-West regions had 97.982 GWh stored, 1% below the level observed in June 2025.

Reservoir level (% of maximum)

Prepared by the authors with data from ONS.

Table 7 — Verified reservoir storage level (%)

Subsystem	June 2025	June 2026	Change (p.p.)
Northeast	69%	89%	+20,3
North	97%	94%	-2,8
Southeast/Center-West	66%	66%	-0,9
South	84%	62%	-22,0

Source: prepared by the authors with data from ONS.

2.5 Electric power consumption (EPE)

Consumption in the national market for the supply of electric power to free and captive consumers reached, in June 2026, 46 thousand GWh, 2,8% above the level observed in June 2025.

A captive consumer is a consumer who may buy energy only from the distributor holding the concession or permission in the area where the “user’s” facilities are located. A consumer with a load equal to or greater than 3.000 kW was considered a free consumer and could choose to contract supply from any concessionaire, permit holder or authorized agent of the interconnected system. That limit was later reduced, allowing greater opening of the market.

Industrial consumption of electric power was 16,6 thousand GWh, 1% above the level observed in the same month of 2025, and accounted for 36% of the total electric power consumed in June 2026.

In June 2026, the industrial sector with the largest growth in electric power consumption was extraction of metallic minerals, with a 13% increase in energy consumption compared with the same month of 2025.

Table 8 — Electricity consumption by class (GWh)

Class	June 2025	June 2026	Change
Residential	13.858	14.386	3,8%
Industrial	16.438	16.589	0,9%
Commercial	7.982	8.432	5,6%
Other	6.694	6.812	1,8%
Total	**44.972**	**46.219**	2,8%

Source: prepared by the authors with data from EPE.

Table 9 — Electricity consumption by industrial sector (GWh)

Sector	2025	2026	Change	Share
Metals	4.225	4.064	-4%	25%
Other	2.614	2.621	0%	16%

*Except machinery and equipment.

2.6 Differences Settlement Price (CCEE)

The Differences Settlement Price (PLD) is used to value the purchase and sale of energy in the short-term market. The PLD is a value set weekly for each load level based on the marginal cost of operation, limited by a maximum and a minimum price in force for each settlement period and for each submarket.

The duration intervals of each level are set for each settlement month by the ONS and reported to the Electric Energy Trading Chamber (CCEE), so that they are taken into account in the accounting and settlement system.

The calculation of the monthly average PLD by submarket considers the weekly prices by light, medium and heavy load level, weighted by the number of hours in each level and in each week of the month, for all regions.

In the Southeast and Central-West, the PLD observed in June 2026 was R$ 188/MWh, 20% below the level recorded in the same month of 2025. For the South, the PLD was R$ 194/MWh, an 18% reduction from the same month of the previous year. The Northeast recorded R$ 184/MWh, a 20% reduction from the same month of the previous year. The North had a PLD of R$ 187/MWh, a 20% reduction compared with June 2025.

Average PLD in June 2026 (R$/MWh)

Prepared by the authors with data from CCEE.

2.7 Electricity supply continuity indicators.

Continuity of energy supply is monitored by ANEEL through the Equivalent Duration of Interruption per Consumer Unit (DEC) and the Equivalent Frequency of Interruption per Consumer Unit (FEC). The DEC and FEC indicators are published for subdivisions of the distributors, called sets of consumer units.

2.7.1. Equivalent Duration of Interruption per Consumer Unit (DEC)

DEC is an indicator prepared by ANEEL that measures the average time, in hours, that each set of consumer units was without electric power in a given month.

DEC/Limit compares the observed DEC with the limit set by ANEEL. This index shows whether the distributor is within the required standard (less than or equal to one) or exceeded (greater than one) the maximum interruption time set by ANEEL.

In June, the distributor MUXENERGIA had the best performance in terms of average interruption time, with a DEC of 0,24, followed by EFLJC (0,32) and EFLUL (0,45), respectively.

These indicators are measured for interruptions lasting 3 minutes or more.

2.7.2. Equivalent Frequency of Interruption per Consumer Unit (FEC)

The FEC indicator is set by ANEEL and measures the average number of times each set of consumer units had its energy supply interrupted in a given period.

FEC/Limit compares the observed FEC with the limit set by ANEEL. As with DEC/Limit, this index shows whether the frequency of interruptions is within the standard set by ANEEL (less than or equal to one) or was exceeded (greater than one).

In June, AME, ELFSM and ESS had the best performance in terms of average frequency of supply interruptions, all recording a FEC of 0,59.

These indicators are measured for interruptions lasting 3 minutes or more.

Between June 2025 and June 2026, the average duration of interruptions in Brazil was 9 hours and 4 minutes. The average number of interruptions reached 4,56.

3 Oil

3.1 Oil production, foreign trade and processing (ANP)

National oil production, in June 2026, was 134 million barrels of oil equivalent (1 bep equals 0,16 m^3), a volume 19% higher than that produced in the same month of the previous year.

The average API gravity (a scale that measures the density of liquids derived from oil) of the oil produced in June 2026 was 28,4°, with 3,9% of production considered light oil (greater than or equal to 31°API), 89,3% considered medium oil (between 22°API and 31°API) and 6,8% considered heavy oil (less than 22°API).

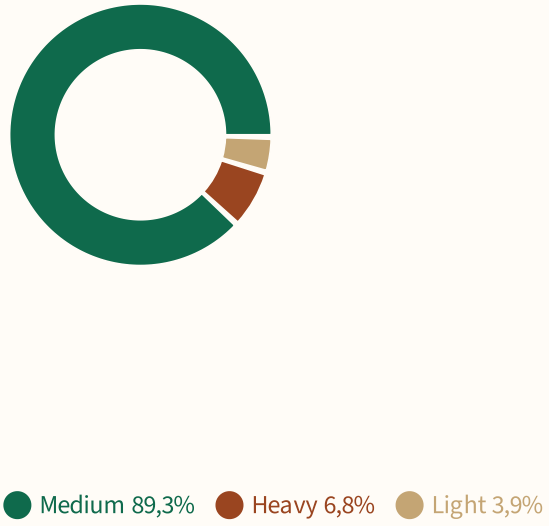

According to the ANP, in June 2026, about 98,1% of Brazil's oil production was extracted from offshore fields.

The volume corresponding to oil processing at national refineries, in June 2026, was 63 million bep. That volume was 5% higher than that observed in the same month in 2025.

The volume of oil exported by the country, in June 2026, was 60,6 million bep, a volume 7% higher than that exported in June 2025. Oil imports were 6,7 million bep, a volume 15% lower than that observed in the same month of the previous year. Apparent oil consumption reached 80,3 million bep.

The average price of oil imported by the country, in June 2026, was US$ 114/barrel, 65% higher than that observed in June 2025.

Quality of oil produced in June 2026

Prepared by the authors with data from ANP.

Table 10 — Oil production and foreign trade (million boe)

Oil	June 2025	June 2026	Change
Production (a)	112,7	134,2	19%
Imports (b)	7,9	6,7	-15%
Exports (c)	56,8	60,6	7%
Apparent consumption (a+b−c)	63,8	80,3	26%

Source: prepared by the authors with data from ANP.

3.2 Production and foreign trade of petroleum-derived fuels (ANP)

In June 2026, national production of petroleum products was 65 million bep, a volume 1% higher than that produced in June 2025.

Imports of petroleum products, in June 2026, were 14 million bep, 18% below the figure recorded in June of the previous year. As for exports of petroleum products, in June 2026 a total of 15 million bep was recorded, which represents a volume 25% higher than that observed in the same month of 2025.

In June 2026, external dependence on petroleum products was -2% relative to apparent consumption of 64 million bep.

Table 11 — Petroleum products (million boe)

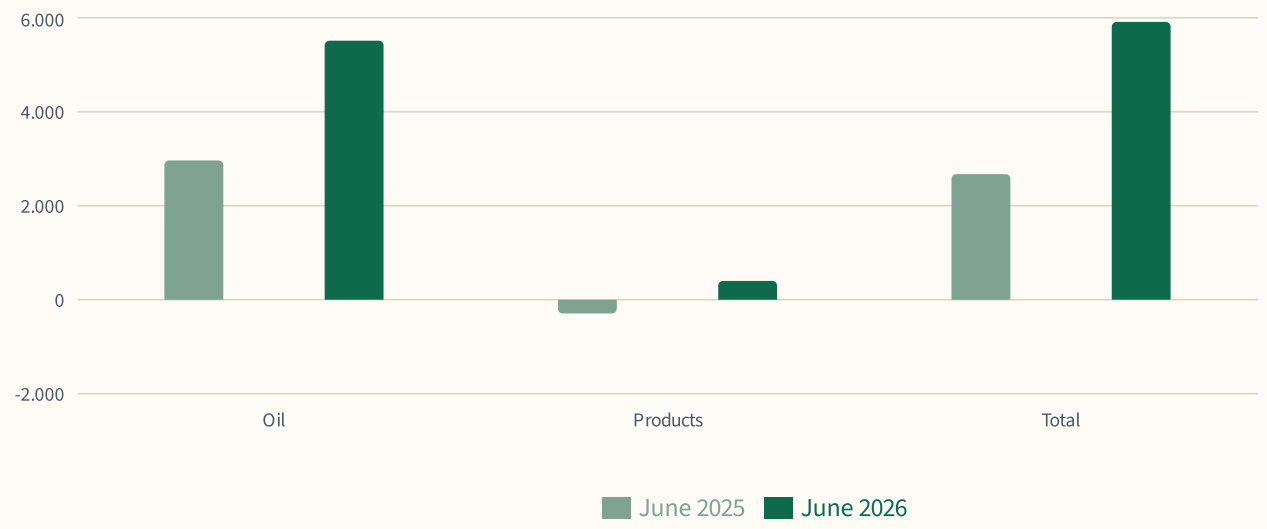

Products	June 2025	June 2026	Change
Production (a)	64,9	65,4	1%
Imports (b)	16,5	13,5	-18%
Exports (c)	11,7	14,6	25%
Apparent consumption (a+b−c)	69,7	64,2	-8%

Source: prepared by the authors with data from ANP.

3.3 Trade balance of oil and petroleum products (ANP)

Brazil's trade balance of oil and petroleum products, in June 2026, showed a positive balance of US$ 5.912 million FOB. That is, Brazil exported US$ 5.912 million FOB more than it imported. In the same month of the previous year, that balance was positive by US$ 2.672 million FOB.

Trade balance (US$ million FOB)

Prepared by the authors with data from ANP.

Table 12 — Trade balance of oil and products (US$ million FOB)

Item	June 2025	June 2026	Change
Oil export revenue	3.511	6.283	79%
Oil import spending	548	771	41%
Oil balance	2.964	5.512	—
Products export revenue	912	1.703	87%
Products import spending	1.204	1.302	8%
Products balance	-292	400	—
Total export revenue	**4.424**	**7.985**	81%
Total import spending	**1.752**	**2.073**	18%
Total balance	**2.672**	**5.912**	—

4 Biofuels

4.1 Biodiesel production (ANP)

National biodiesel production, in June 2026, was 845 thousand m^3, an amount 8% higher than that produced in June 2025.

The price of diesel oil (blended with biodiesel), in June 2026, was R$ 6,78/ℓ, 14% higher than that recorded in June 2025.

Biodiesel in June

Indicator	June 2026	Vs Jun/2025
Production	845 thousand m^3	8%
Diesel with biodiesel, consumer price	R$ 6,78/ℓ	14%

Source: prepared by the authors with data from ANP.

4.2 Alcohol

4.2.1. Alcohol and sugar production (MAPA)

The 2025/2026 crop produced, through June 2026, 12 million m^3 of alcohol. Of that total, 65% refers to production of hydrous ethyl alcohol, which is ordinary ethanol, sold at gasoline stations, while anhydrous ethanol is that blended into gasoline. Total alcohol production was 22% higher than in the same period of the previous crop.

Sugar production in the same period was 11 million tonnes, a volume 13% lower than that observed in the same period of the 2024/2025 crop.

Crops begin in April and end in August of the following year. Thus, for four months two parallel crops are observed in the different Brazilian states.

4.2.2. Sales of hydrous ethyl alcohol (ANP)

Sales of hydrous ethyl alcohol were 1,8 million m^3 in June 2026. This figure represents an 11% increase relative to the volume sold in June of the previous year.

Sales of hydrous ethyl alcohol accounted for 32% of the universe of alcohol and gasoline sales in June 2026. That share was 1,2 percentage point higher than that observed in June of the previous year.

In June 2026, the average consumer price of hydrous ethyl alcohol was R$ 4,13/ℓ, 2% lower than that observed in the same month of the previous year.

[1]Gasoline C: Gasoline A + a percentage of anhydrous alcohol.

2025/2026 crop alcohol through June

Prepared by the authors with data from MAPA.

12 million m^3, 22% above the same point of the previous crop.

Table 13 — Cumulative alcohol and sugar production

Product	Through June 2026	Vs previous crop
Alcohol	12 million m^3	22%
Sugar	11 million t	-13%

Source: prepared by the authors with data from MAPA. 2025/2026 crop through June 2026.

5 Natural gas

5.1 Natural gas production and supply (MME)

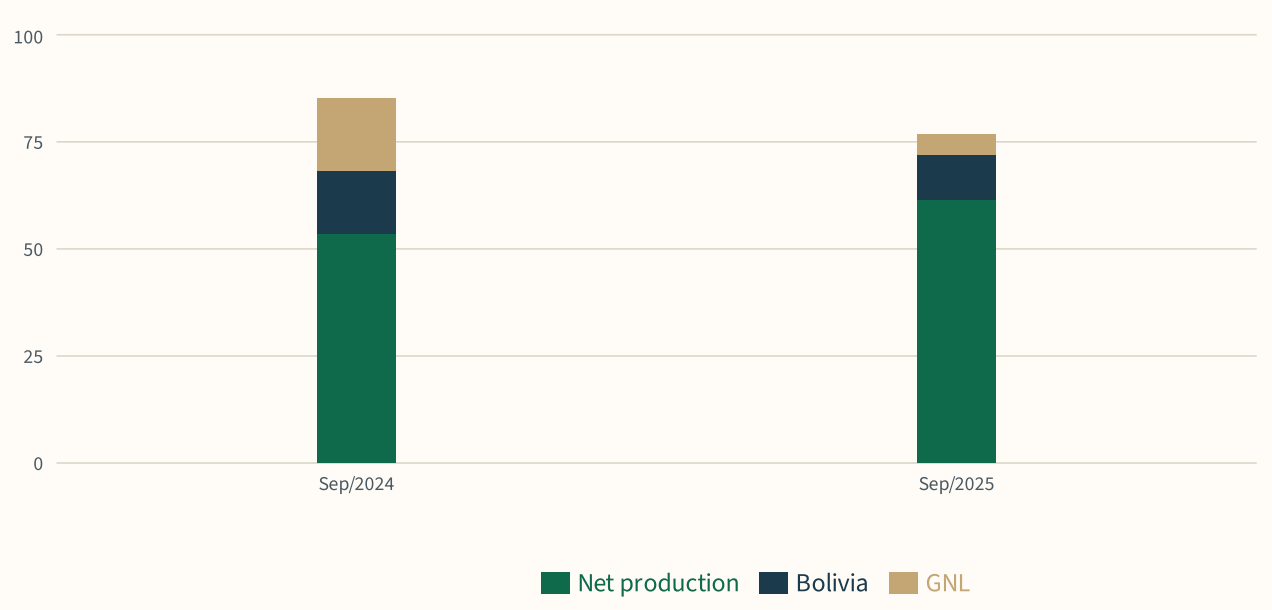

According to the most recent data released by the MME, average daily national production of natural gas, in September 2025, was 191 million m^3/day, an increase of 12% compared with September of the previous year.

Average imports of natural gas (GN) from Bolivia, in September 2025, were 10,5 million m^3/day, a volume 28% lower than that observed in the same month of 2024. Average imports of liquefied natural gas (LNG), in September 2025, totaled 5 million m^3/day, a volume 71% lower than the amount observed in the same month of the previous year.

In September 2025, total natural gas supply totaled 76,8 million m^3/day, 10% below the level observed in the same month of the previous year.

The share of natural gas burned, lost, reinjected and consumed at exploration and production (E&P) units was 68,5% in September 2024. In September 2025, that share was 67,8%.

Natural gas supply (million m^3/day)

Prepared by the authors with data from MME.

National production in the table does not include LNG.

Table 14 — Natural gas balance (million m³/day)

Item	September 2024	September 2025	Change
National production	169,9	190,6	12%
− Reinjection	93,5	102,2	9%
− Flaring and losses	3,6	4,1	13%
− Own use	19,2	22,9	19%
= Net production	53,6	61,4	15%
+ Imports from Bolivia	14,6	10,5	-28%
+ LNG regasification	17,0	4,89	-71%
= Supply	85,2	76,8	-10%

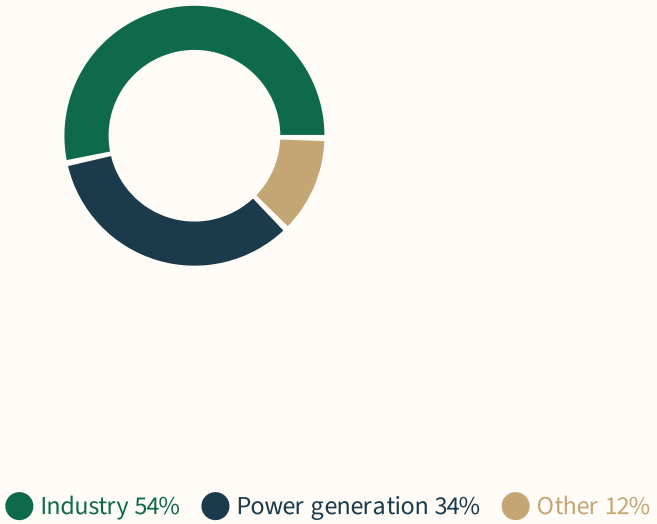

Source: prepared by the authors with data from MME.

5.2 Natural gas consumption (MME)

Natural gas consumption in the country in September 2025 was, on average, about 76 million m³/day. That average is 7% lower than the average daily volume consumed in September 2024. Industry consumed approximately 41 million m³/day of natural gas, a volume 2% higher than that recorded in the same month of the previous year.

Electric generation accounted for 34% of natural gas consumption in September 2025. Industry accounted for 54% of the total volume of gas consumed in the same month.

Natural gas consumption in September 2025

Prepared by the authors with data from MME.

About 76 million m^3/day, 7% below September 2024.

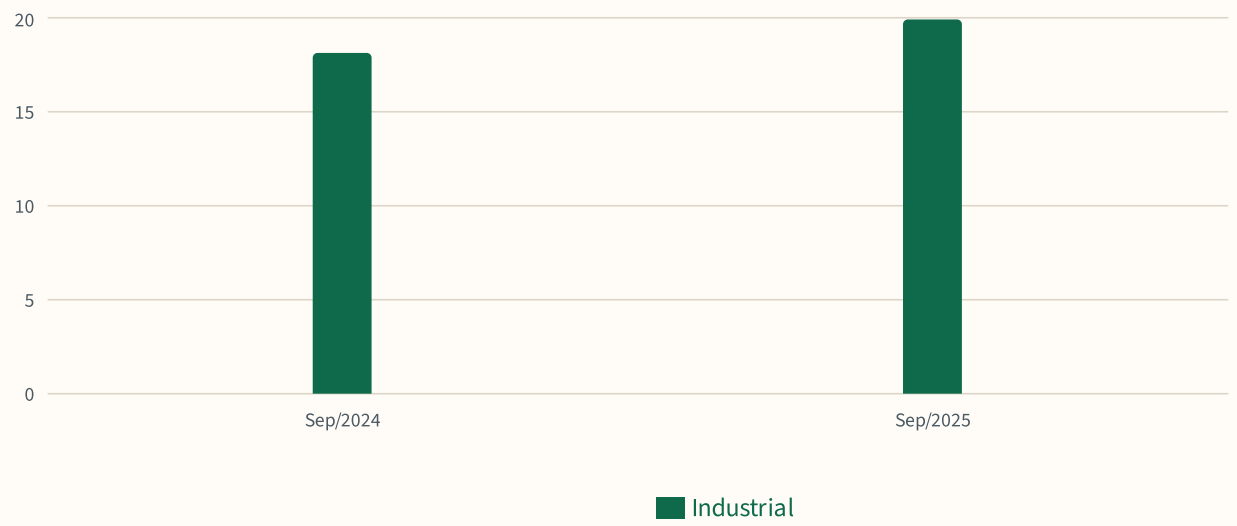

5.3 Natural gas price (MME and EIA)

The average price of natural gas to the industrial consumer, in September 2025, was US$ 19,91/MMBtu, 10% higher than that observed in September 2024 (US$ 18,13/MMBtu).

In September 2025, the average price of natural gas on the Henry Hub spot market was US$ 2,97/MMBtu, 30% higher than that recorded in September 2024. This price does not include taxes and transportation, and is set on business days in trades for next-day delivery.

[1]Price with tax and transportation cost. Monthly average. [2]Price without tax and transportation cost. Monthly weighted average of daily quotes.

Industrial consumer gas price (US$/MMBtu)

Prepared by the authors with data from MME. Henry Hub in Sep/2025: US$ 2,97 (+30%).

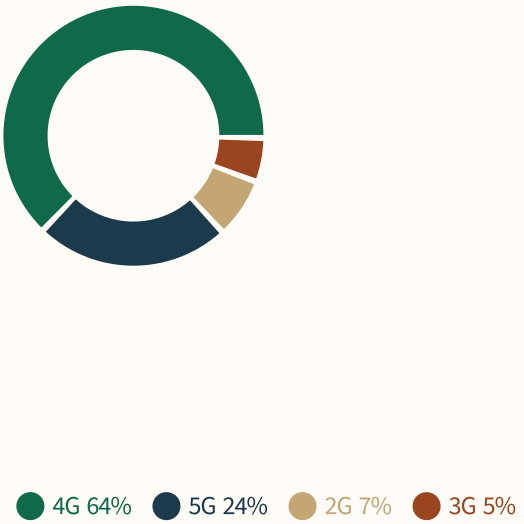

6 Telecommunications

6.1 Active contracted mobile internet services (ANATEL)

Approximately 278 million mobile accesses were made in June 2026, 4% higher than that observed in the same month of the previous year. Of those accesses, 24% were made on 5G technology, 64% on 4G technology, 5% on 3G technology and 7% on 2G technology.

In June 2026, 5G technology accounted for the largest growth relative to June 2025 (37%), while 3G technology showed the largest decline (15%).

Mobile base mix in June 2026

Prepared by the authors with data from Anatel.

Table 16 — Mobile accesses by technology (million)

Technology	June 2025	June 2026	Change	Share
2G	18,9	18,8	0%	7%
3G	16,7	14,1	-15%	5%
4G	182,0	177,6	-2%	64%
5G	48,9	67,2	37%	24%
Total	**266,5**	**277,8**	4%	**100%**

Source: prepared by the authors with data from Anatel.

6.2 Fixed internet accesses (ANATEL)

In June 2026, 58 million fixed internet accesses were made, 7% higher than that recorded in the same month of the previous year. Of total accesses, 95% were made at a speed above 34 Mbps, which represents growth of 9% relative to accesses made in June 2025 in that same band.

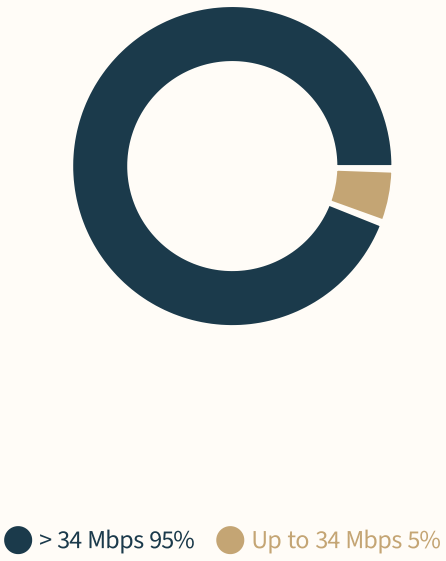

The increase in high-speed accesses follows the growth in the use of fiber optics, which rose 10% compared with the same period of the previous year. Fiber optics is the technology with the largest number of accesses in Brazil, covering 81% of the market.

Fixed accesses by technology

Prepared by the authors with data from Anatel. June 2026.

Accesses by speed band

7 Transport

7.1 Selected ports and private-use terminals (ANTAQ)

7.1.1. Cargo movement

ANTAQ port throughput data are released with a lag relative to the publication month of the report. The data available were used.

In February 2026, total cargo handled at public ports and private-use terminals (TUPs) was 101 million tonnes, a volume 4% higher than in the same month of 2025.

TUPs accounted for 67% of total cargo throughput at ports and terminals in February 2026. Total throughput at TUPs was 68 million tonnes, a volume 10% higher than that observed in the same month of 2025. Public ports handled 33 million tonnes, a volume 6% lower than that recorded in the same month of the previous year.

The number of containers handled at all organized ports and private terminals in the country, in February 2026, was 1192 thousand TEUs (twenty-foot equivalent unit), a volume 4% higher than in

the same month of the previous year.

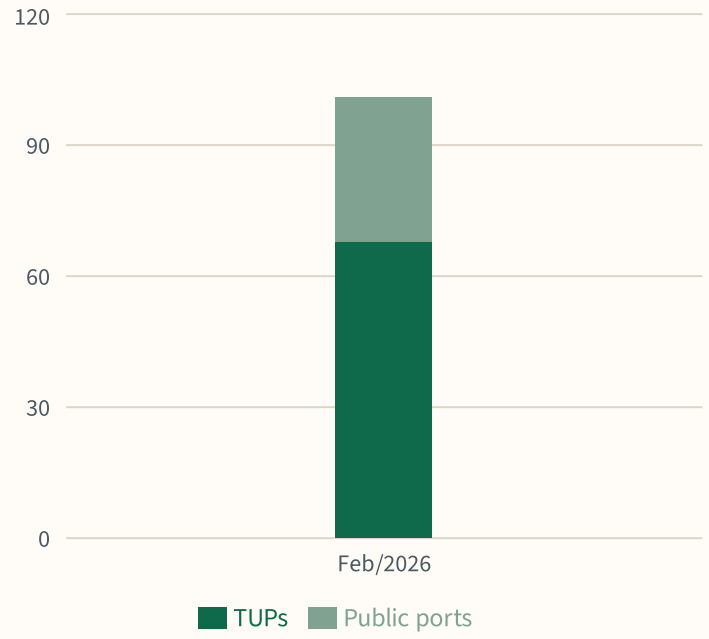

In February 2026, long-haul navigation accounted for 68% of total cargo throughput, followed by cabotage (24%), inland navigation (7%) and maritime and port support (less than 1%).

In cabotage, 24 million tonnes were handled, 9% higher than that observed in February 2025.

Private ports accounted for 75% of the cargo handled, totaling 18 million tonnes in February. Public ports handled 6 million tonnes, 25% of total throughput.

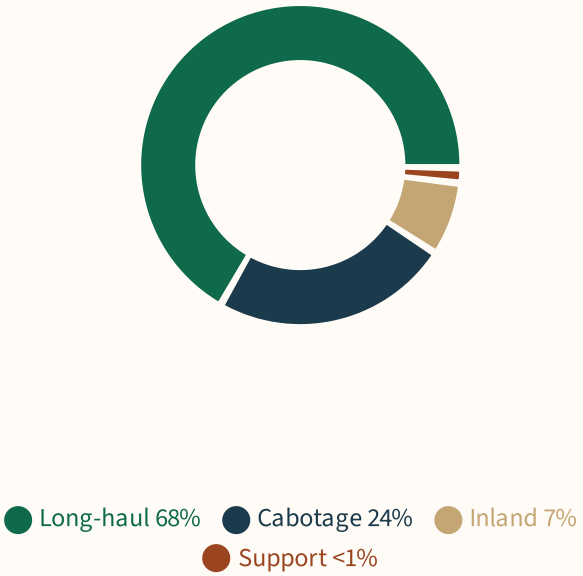

The main cargoes handled, in tonnes, were liquid and gaseous bulk (15,9 million t), followed by solid bulk (4 million t), containerized cargo (3,8 million t) and general cargo (0,8 million t).

Who moved the cargo in February 2026 (million tonnes)

7.1.2 Capacity used at container terminals

In June 2026, among the ten busiest terminals, the SUAPE container terminal had the highest level of utilization, with 100% occupancy.

7.1.3. Cancellations, omissions and delays at container terminals

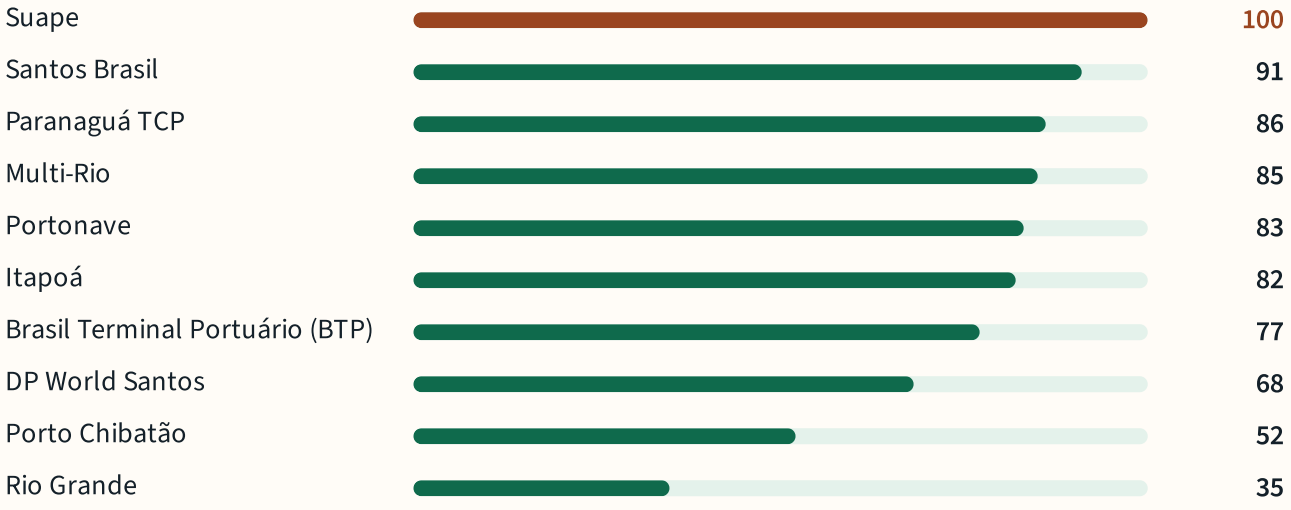

Of the 3173 container operations scheduled in long-haul navigation from January to June 2026, 651 cases of omissions or cancellations were recorded (21% of the total).

The Paranaguá TCP terminal had the largest number of problems (109), followed by Santos Brasil (100) and Brasil Terminal Portuário – BTP (69).

As for the punctuality of movements at these facilities, from January to June 2026 there were 1096 cases of delay, which represents 35% of the total. In that period, the facility with the largest number of operations that were not on time was Brasil Terminal Portuário (BTP), with 177 delay records.

From January to June 2026, 55% of shipments scheduled at the country's container terminals suffered delays, omissions or cancellations.

Container terminal utilization in June 2026 (%)

SOLVE Shipping. Suape, at 100%, is the highest level among the ten busiest.

7.2 Air transport (ANAC)

Paid passenger traffic in June 2026, adding the domestic and international markets, was 10,3 million passengers, 1% below the figure recorded in the same month of the previous year. Domestic passengers accounted for 79% of total traffic in June 2026.

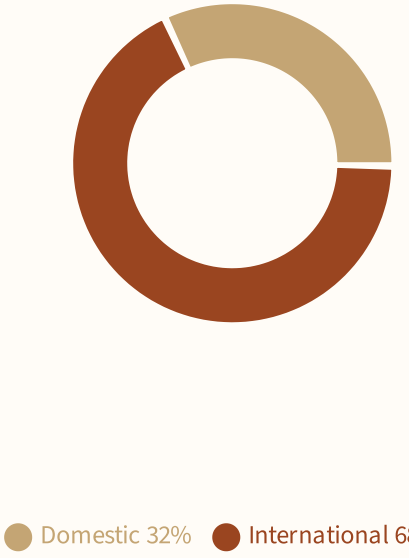

Total air cargo traffic in the country, in June 2026, adding the domestic and international markets, was 119 thousand tonnes, an amount 9% higher than that recorded in the same month of the previous year. Domestic cargo accounted for 32% of total cargo handled in the period.

Passengers in June 2026

Prepared by the authors with data from ANAC. Total: 10,3 million (−1%).

Prepared by the authors with data from ANAC. Total: 119 thousand t (+9%).

7.3 Rail freight (ANTT)

Freight moved on the railways, in June 2026, was 49 million useful tonnes (TUs), approximately the level observed in the same month of 2025. Potassium chloride was the cargo with the largest growth (41%). Iron ore accounted for 71% of the total moved in June 2026.

Iron ore in the June 2026 total

Prepared by the authors with data from ANTT.

Table 21 — Rail freight (thousand useful tonnes)

Commodity	June 2025	June 2026	Change
Iron ore	35.017	34.841	-1%
Soybeans	5.347	5.366	0%

7.4 Tolled road traffic (ABCR)

In June 2026, traffic on federal and state tolled highways was 174 million vehicles, 17% higher than that recorded in the same month of the previous year. Light vehicles accounted for 65% of total traffic, followed by heavy vehicles (31%) and motorcycles (1%). Exempt traffic on tolled highways totaled 5 million vehicles, which represents 3% of the total.

Heavy-vehicle traffic in June 2026 was 53,4 million vehicles, equivalent to 31% of all tolled traffic. That figure was 34% higher than that observed in the same month of the previous year. Tolled traffic of light vehicles was 114 million vehicles, 11% higher than that recorded in June 2025.

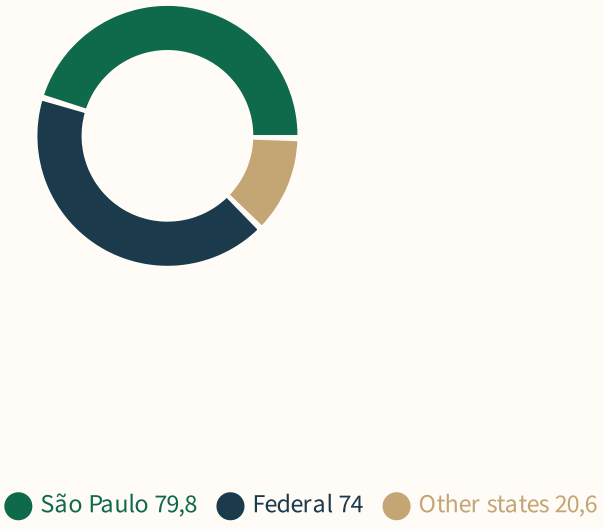

The breakdown by type of highway management shows that traffic on federal tolled highways was 74 million, 29% higher than that observed in June 2025. On state tolled highways, traffic was 100,5 million, 10% higher than that observed in the same month of the previous year. Of that total, 79,8 million vehicles traveled on highways in the state of São Paulo, and 20,6 million in other states.

Classes in June (million vehicles)

Prepared by the authors with data from ABCR. Table 22.

7.5 Accidents on federal highways (PRF)

In June 2026, 6.184 accidents were recorded on Brazilian federal highways, according to the Federal Highway Police (PRF). The total number of accidents is 1% higher than in the same month of 2025.

The stretches of federal highways that concentrated the most accidents between January and June 2026 were BR 101/SC (2053 accidents), BR 116/SP (1530 accidents) and BR 381/MG (1433 accidents).

Table 23 — Accidents by stretch, cumulative through June

7.6 Consumer price of regular gasoline and diesel oil (ANP)

The average price of regular gasoline, in April 2026, was R$ 6,74/L, 7% higher than that observed in April 2025 (R$ 6,32/L).

According to the latest data released by the ANP on price composition and formation, for April 2026, federal taxes accounted for 10% of the price of regular gasoline, 1 percentage point (p.p.) lower than in the same period of the previous year. State taxes accounted for 23% of the price, a decrease of 0 p.p. compared with the same period of the previous year. Distribution-plus-retail margins rose 2 p.p. in the period.

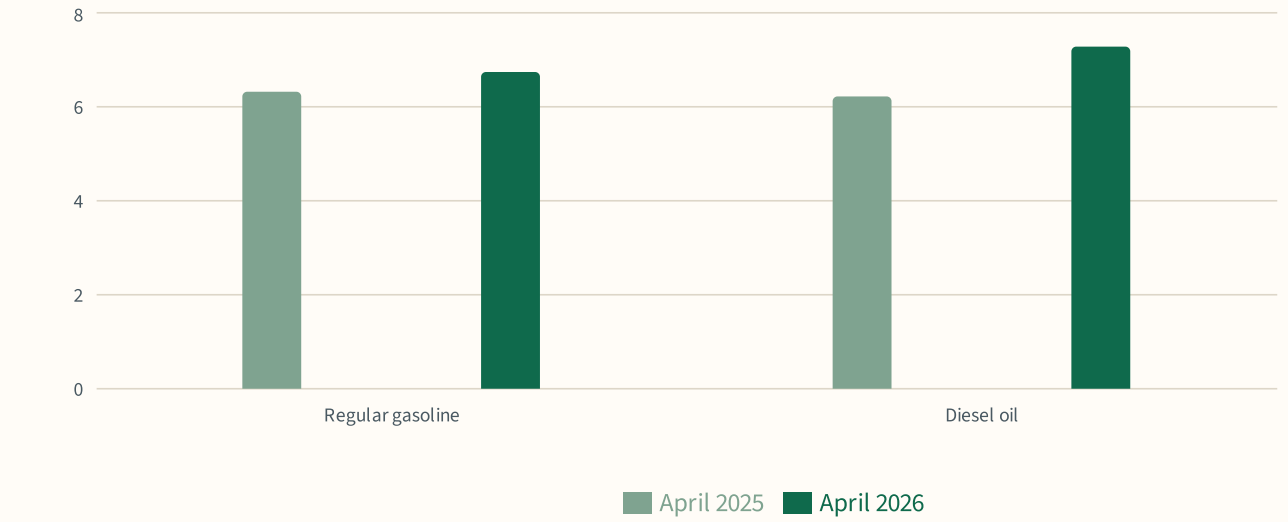

The average price of diesel oil, in April 2026, was R$ 7,28/L, 17% higher than that observed in April 2025 (R$ 6,22/L).

According to the most recent information made available by the ANP on price composition and formation, for April 2026, federal taxes accounted for 0% of the diesel oil price, 5 percentage points (p.p.) lower than in the same period of the previous year. State taxes accounted for 3% of the price, a decrease of 15 p.p. compared with the same period of the previous year. Distribution-plus-retail margins rose 12 p.p. in the period.

Note: *Price of biodiesel with freight and taxes.

Following the end of the Federal Government's provisional measure, federal taxes were reinstated from 01/01/2024.

Average consumer price (R$/L)
